

# MATTER

---

We will begin our science unit on MATTER. During this unit students will understand and identify the physical properties of matter, and through experimentation that chemical and physical changes occur in matter. Students will identify observable evidence of a chemical reaction.

This science unit will be a fun one for all of us! Most science lessons for this unit will require group work and hands-on experiments. Students must be willing to work as a team member, be responsible for materials, and clean up. All papers and assignments given during this unit will be kept in the student folder and graded upon completion of each. Class attendance and participation will be very important for this unit! For many experiments, making them up at school will not be an option. Therefore, any experiment missed will need to be done at home, experiment paper completed and returned for a grade. Class participation, all assignments, and a final assessment will make up your grade for this unit.
